

Data Quality of the NYC TLC High-Volume For-Hire Vehicle Trip Records, April 2020–July 2026

Prepared by EK

October 2, 2026

1 Summary

This report audits the full TLC High-Volume FHV (HVFHV) trip-record series from April 2020 through July 2026 (76 monthly files, 1,337,878,593 trip records). Everything is computed on the raw files with no cleaning filters unless a panel says otherwise. All timestamps are local New York wall-clock time.

1. Is any data missing?

- **Months, days, hours.** All 76 monthly files are present with no gap in the month sequence. Section 4 lists the 3 citywide days that fall below 50% of their centered 28-day median or have zero trips; 0 of them are not explained by a documented event or holiday. There are 9 hours with zero citywide trips.
- **Platforms.** Uber and Lyft appear throughout. Via’s records run from 2020-04 to 2021-10, ending abruptly after 2021-10-10 (about 2,884 trips per day before then), although Via stated that it ran its New York City rideshare service until 2021-12-20 (Via, 2021), so roughly ten weeks of Via operation are not in the file; the cause is unknown. Juno has 0 records in this period; unrecognized license codes (“other”) account for 0 records.
- **Fields.** Two nulls are structural: `cbd_congestion_fee` is 70.75% null over the full period because it first appears in 2025, and `airport_fee` is 9.28% null (a null-typed column in 2020-04 and 2020-10, and null through part of 2021). Three fields are missing for *reporting-practice* reasons that differ by platform and period (Table 5): `on_scene_datetime` is populated for Uber but null for 73.0% of Lyft records overall (99.8% before 2025) and 99.0% of Via records, so it is not “Accessible Vehicles only” as the dictionary states; `originating_base_num` is blank for 99.8% of Lyft and 99.0% of Via records; and `access_a_ride_flag` is blank (not “N”) for 49.2% of Uber records, through 2023-11. Every other numeric field and timestamp has a null share of at most 0.00%.

2. Does every ride from these companies end up in the data? Not necessarily, and the reasons are partly by design (Section 3). The records cover trips dispatched through HVFHS bases; cancelled requests, trips dispatched by other bases, and taxi trips booked through ride-hail apps are not in this file. Against TLC’s own published aggregates, the record counts differ by 0.00% to 0.10% per year against the base aggregate report and by 0.00% to 1.52% against the industry indicators; 0 of 167 platform-months differ by more than 2% (largest: 0.67% in 2026-01 (Uber)), and 1 of 74 months differ by more than 2% against the industry indicators (7.17% in 2026-05).

Both TLC series are derived from the same base submissions, so this is a consistency check, not an independent count of all rides: it shows the public file reproduces what bases reported, not that bases reported everything.

3. Summary statistics. Table 6 gives mean, standard deviation, median, minimum, maximum and % missing for every main variable over the whole period, raw (Panel A) and after the cleaning filters (Panel B). The filters keep 95.72% of records overall.

2 Data and coverage

The source is the TLC monthly HVFHV parquet files (`fhvhv_tripdata_YYYY-MM.parquet`), downloaded 2026-09-26 and checked against the download manifest (byte sizes match). The series starts in 2019-02; this report covers 2020-04 onward by choice. The sum of per-month record counts in the audit equals the sum of the parquet footer row counts, so no row was silently dropped by the audit. Schema drift handled in the audit: `airport_fee` is a null-typed column in 2020-04 and 2020-10; from 2023-02 strings are stored as large strings and location IDs as 32-bit integers; from 2025-01 a 25th column, `cbd_congestion_fee`, appears. Field definitions follow the TLC data dictionary ([New York City Taxi and Limousine Commission, 2023](#)). TLC states, for its taxi data, that the trip data were not created by the TLC and that it cannot guarantee their accuracy ([New York City Taxi and Limousine Commission, 2019](#)), and for FHV base data that it publishes them as submitted by the bases and cannot guarantee their accuracy or completeness ([New York City Taxi and Limousine Commission, 2026a](#)); this is the reason the audit reports anomalies instead of assuming clean inputs.

3 What the law requires reported, and what is excluded

Who reports. Local Law 149 of 2018 defines a high-volume for-hire service as a business, operating under one brand or trade name, that connects passengers to for-hire vehicles through software and dispatches 10,000 or more trips in the city in one day; all bases under a common brand are counted together ([New York City Council, 2018](#)). TLC’s user guide records that the HVFHS license class was created in 2019 and that, as of February 2019, the qualifying companies were Uber, Lyft, Via and Juno ([New York City Taxi and Limousine Commission, 2019](#)).

What must be reported. TLC’s rules in Chapter 59 of Title 35 of the Rules of the City of New York, section 59D-14, require an HVFHS to transmit, for the trips it dispatches, the pickup and drop-off date, time and location; the driver and vehicle license numbers; the affiliated base; passenger count; trip mileage; the date and time the passenger requested the trip; the itemized fare (fare, tolls, surcharges, commission rate, deductions, gratuity); the payment the driver received; and an indicator for MTA Access-A-Ride trips ([New York City Taxi and Limousine Commission, 2021](#)). The 2021 amendment also added driver availability records, weekly driver earnings statements, and trip-level time and mileage outside city limits ([New York City Taxi and Limousine Commission, 2021](#)). The public HVFHV files expose a subset of these fields and omit driver identifiers.

What is excluded by design.

- *Trips dispatched by other bases.* The FHV data include high-volume bases and also community livery, luxury limousine and black-car bases ([New York City Taxi and Limousine Commission,](#)

2019); the HVFHV file contains only the high-volume license class, so trips dispatched through smaller bases are not in it.

- *Taxi trips booked through apps.* Yellow taxis can be hailed through e-hail apps such as Curb and Arro (New York City Taxi and Limousine Commission, 2019), and Uber announced in 2022 that New York taxis would be integrated into its app (The Drive, 2022). Taxi trips are recorded in the taxi files, so such trips would not be in the HVFHV file. We have not verified how TLC classifies them.
- *Cancelled or unfulfilled requests.* The rule text refers to trips the service dispatches (New York City Taxi and Limousine Commission, 2021), and TLC’s user guide says it collects records for each trip *completed* by licensed drivers and vehicles (New York City Taxi and Limousine Commission, 2019). We found no explicit statement on how cancelled requests are treated, and the files contain no cancellation field; the documentation points to completed or dispatched trips only, but this is not stated outright by a primary source.[?]
- *Privacy.* The public files report pickup and drop-off at the taxi-zone level and omit driver identity.
- *Access-A-Ride.* The rules require an indicator for MTA Access-A-Ride trips (New York City Taxi and Limousine Commission, 2021), and these trips are included and flagged (`access_a_ride_flag`); 647,876 records carry “Y” (0.048% of all records). The flag is blank for 477,864,177 Uber records through 2023-11, so Access-A-Ride trips cannot be identified for Uber before then.

TLC’s base aggregate report carries its own caveat: TLC publishes base trip record data as submitted and cannot guarantee its accuracy or completeness (New York City Taxi and Limousine Commission, 2026a).

Platform entry and exit. Juno stopped operating in New York in November 2019 (Lunden, 2019), before this sample, consistent with 0 Juno records here. Via’s first and last month in the records are 2020-04 and 2021-10 (Table 1); its last day with a full volume of trips is 2021-10-10. Via announced that it would discontinue its New York City rideshare service on 2021-12-20 (Via, 2021), so records for the final weeks of Via’s operation are absent from the HVFHV file. We cannot tell from the data whether Via stopped reporting, moved those trips to another license class, or reported them elsewhere; this is an open question for TLC.

4 Completeness

Table 1: Trip records by platform and year

Platform	2020	2021	2022	2023	2024	2025	2026	First month	Last month
Uber	63,021,768	126,129,064	153,847,310	167,127,330	179,125,798	175,989,546	106,575,555	2020-04	2026-07
Lyft	23,419,298	47,575,769	58,568,773	65,362,690	60,344,650	67,600,138	41,117,676	2020-04	2026-07
Via	1,181,409	891,819	0	0	0	0	0	2020-04	2021-10
Juno	0	0	0	0	0	0	0	never	never
other	0	0	0	0	0	0	0	never	never

Figure 1: Monthly trip records by platform, with the sum of TLC’s base aggregate report for the same bases (dashed).

Benchmark against TLC aggregates. Platform bases were mapped to companies using the `dispatching.base_num` values observed in the trip data. Table 2 compares record counts with the FHV Base Aggregate Report (New York City Taxi and Limousine Commission, 2026a) and with the HVFHS trips per day in TLC Industry Indicators (New York City Taxi and Limousine Commission, 2026b) (trips per day times days in month; available through 2026-05). Monthly detail is in `output/sum/dq_benchmark_monthly.csv`.

Table 2: Records versus TLC aggregates, by year

Year	Records	Base aggregate	Gap (%)	Industry indicators	Gap, ind. (%)
2020	87,622,475	87,622,499	0.00	87,566,491	0.06
2021	174,596,652	174,598,491	0.00	174,581,434	0.01
2022	212,416,083	212,408,067	0.00	212,411,973	0.00
2023	232,490,020	232,492,922	0.00	232,489,163	0.00
2024	239,470,448	239,471,438	0.00	239,470,350	0.00
2025	243,589,684	243,589,684	0.00	243,589,009	0.00
2026	105,996,114	105,895,187	0.10	104,413,071	1.52

Missing days and hours. Figure 2 marks citywide days that are zero or below 50% of the centered 28-day median. Table 3 lists them with an explanation where a documented event or holiday applies. A dip is labelled “explained” only if it matches a listed event; everything else is “unexplained” and should not be read as missing data or as a real event without further checking. Events used for labelling are listed in `make_dq_report_tables.py`; the 2026 winter storms are documented in North Brooklyn News (2026); Al Jazeera (2026). The 9 hours with zero citywide trips all fall between 2020-06-02 22:00:00 and 2020-06-06 23:00:00, in the June 2020 curfew window; 9 of them match that event. Platform-level flags (including Via’s zero-trip days after its last month in the data) are in `output/sum/dq_flagged_days_all.csv`.

Figure 2: Citywide trip records per day; flagged days marked.

Table 3: Flagged citywide days

Date	Trips	Ratio to median	Rule	Explanation
2021-02-01	176,946	0.44	<50% of median	Snowstorm
2026-01-25	322,276	0.46	<50% of median	Winter Storm Fern
2026-02-23	160,836	0.23	<50% of median	Blizzard / NYC travel ban

5 Missing fields

6 Summary statistics

7 Anomalies and recommended cleaning rules

Table 8 reports each rule as a percent of records by year. Overall, 1,517,558 records have a fare at or below zero (0.113%), 236,202 have zero miles, 123,970 have trip time of 60 seconds or less, and 54,817,466 (4.097%) have an unknown drop-off zone (264/265). There are 10,872 exact duplicate rows. 13,377,629 records (1.000%) have a request time after the pickup time, which gives a negative `wait.time`. 12.788% of records have `driver.share` above 1 (driver pay exceeding the fare); by year this ranges from 10.81% (2022) to 15.57% (2021). Because `driver.pay` is net of commission and excludes tips, a share above 1 means the platform paid more than the base fare, and it is not a unit error we can fix by filtering; we report it rather than drop it.

Do the cleaning rules bite evenly over time? The share of records passing the filters ranges from 95.18% (2025) to 96.80% (2020). A filter that removes much more in some periods changes the sample composition, so apply the same rules in every period and report drops by window.

Recommended rules. Keep the CLAUDE.md project filters: fare in (0, 1000]; miles in (0, 100]; trip time in (60 s, 6 h]; drop zones 264/265; consider excluding Access-A-Ride. Set negative `wait.time` to missing rather than dropping the trip. Do not filter on `on_scene.datetime`, and do not build a wait-time measure from it: it is populated for one platform only for most of the sam-

Figure 3: Percent of records missing, by numeric field and month.

Figure 4: Monthly median fare per mile and driver share, by platform (raw records).

ple. Note that an Access-A-Ride exclusion based on `access_a_ride_flag` removes flagged trips for Lyft and Via throughout but for Uber only from 2023-11 onward, so it would filter asymmetrically across platforms and time; report results with and without it.

A Post-flight verification (CoVe)

Post-Flight Verification — PARTIAL (amber). Every cited legal, institutional and event claim was extracted into a claims table and checked by a separate `claim-verifier` agent working in fresh context from primary sources only, without seeing this report’s prose (Chain-of-Verification).

- Claims checked: 25 (C1–C15, with C12 split into eleven event dates).
- PASS: 18. PARTIAL: 7. FAIL: 0.
- **Corrected after verification:** the 2020 curfew ended 2020-06-07 (lifted early), not 06-08; the Tropical Storm Henri rain peak was the evening of 2021-08-21 local time, so the event

Table 4: Percent missing by field and year

Variable	2020	2021	2022	2023	2024	2025	2026
hvfhs_license_num	0.00	0.00	0.00	0.00	0.00	0.00	0.00

trip_miles	0.00	0.00	0.00	0.00	0.00	0.00	0.00
trip_time	0.00	0.00	0.00	0.00	0.00	0.00	0.00
base_passenger_fare	0.00	0.00	0.00	0.00	0.00	0.00	0.00
tolls	0.00	0.00	0.00	0.00	0.00	0.00	0.00
bcf	0.00	0.00	0.00	0.00	0.00	0.00	0.00
sales_tax	0.00	0.00	0.00	0.00	0.00	0.00	0.00
congestion_surcharge	0.00	0.00	0.00	0.00	0.00	0.00	0.00
airport_fee [†]	100.00	20.90	0.00	0.00	0.00	0.00	0.00
tips	0.00	0.00	0.00	0.00	0.00	0.00	0.00
driver_pay	0.00	0.00	0.00	0.00	0.00	0.00	0.00
cbd_congestion_fee [†]	100.00	100.00	100.00	100.00	100.00	0.00	0.00

[†] Structural, not incidental: `cbd_congestion_fee` first appears in 2025-01; `airport_fee` is a null-typed column in the 2020-04 and 2020-10 files. [‡] Missingness is specific to a platform and period (Table 5). Blank strings in categorical fields are counted as missing.

window starts that day; two storm labels were made cautious (nor’easter; storm/cold) because NYC-specific severity was not verified; the TLC “cannot guarantee accuracy” sentence appears in the user guide’s *taxi* sections, so for FHV data the report cites the base-aggregate disclaimer instead; the Uber–taxi announcement is dated March 2022; the wording “tabulated from raw trip record submissions” was removed because the dataset description says only “as submitted by the bases”.

- **Flagged as unverified (PARTIAL):** (i) the City Record publication date, hence the exact effective date, of the 2021 amendment to 35 RCNY 59D-14, was not found, so no effective date is stated; (ii) no primary source states how cancelled requests are treated, which is why that exclusion is reported as unconfirmed²; (iii) NYC snowfall for the 2020-12-16 and 2022-01-29 nor’easters and NYC impact of Winter Storm Elliott were not verified (they are used only to label a daily volume dip, and no citywide dip is flagged for those dates, though Lyft alone is flagged on 2022-01-29).
- **Not checked by the verifier:** Local Law 149’s bill number (the law’s own certificate shows Int. No. 838-C, which the report does not cite), and the current codified text of 59D-14 (the report relies on the 2021 notice of promulgation).
- **Verifier:** claim-verifier (fresh context, CoVe). Web pages were read through a summarizing fetch tool, so quotations from web pages are as returned by the tool; PDF and spreadsheet

Table 5: Percent missing for platform-specific fields, by platform and year

Variable	Platform	2020	2021	2022	2023	2024	2025	2026
access_a_ride_flag	Lyft	0.0	0.0	0.0	0.0	0.0	0.0	0.0
access_a_ride_flag	Uber	99.9	100.0	100.0	80.7	0.0	0.0	0.0
access_a_ride_flag	Via	0.0	0.0	–	–	–	–	–
on_scene_datetime	Lyft	99.9	99.9	99.9	99.8	99.7	16.1	0.0
on_scene_datetime	Uber	0.0	0.0	0.0	0.0	0.0	0.0	0.0
on_scene_datetime	Via	98.9	99.2	–	–	–	–	–
originating_base_num	Lyft	99.9	99.9	99.9	99.8	99.7	99.7	99.6
originating_base_num	Uber	0.1	0.0	0.0	0.0	0.0	0.0	0.0
originating_base_num	Via	98.9	99.2	–	–	–	–	–

“–” means the platform has no records that year. Blank strings count as missing.

quotes are verbatim.

Panel A: all raw records. Panel B: after dropping fare ≤ 0 or $> \$1,000$; miles ≤ 0 or > 100 ; trip time ≤ 60 s or > 6 h; unknown zones (264, 265) or null zone; Access-A-Ride trips. Mean, SD, min, max and % missing are exact. Median, P1 and P99 are exact pooled quantiles (DuckDB `quantile_cont`) over all 76 files, one query per variable. `wait_time` = pickup – request (seconds); `driver_share` = `driver_pay`/`base_passenger_fare`; `platform_margin` = fare – driver pay.

Via (2021). A letter to our new york city drivers. Accessed 2026-10-02.

Table 7: Means and medians by year, headline variables

Variable	2020	2021	2022	2023	2024	2025	2026
